1. INTRODUCTION

The design of PSS AVR3 series three-phase automatic segregated compensation electron voltage regulator offers an enhanced level of Transient Voltage Surge & Spike Suppression (TVSS) protection. The AVR3 provides effective and reliable protection against voltage fluctuations and line disturbances, delivering an enhanced level of power protection commonly referred to as a 'CLEAN' supply.

2. INSTALLATION

2.1 SAFETY

Under no circumstances should any work be carried out on the AVR3-80, connections or cabling unless the electricity supply is isolated. Only qualified electricians should work on the AVR and its installation.

2.2 INSTALLATION ENVIRONMENT

When select the installation room, please take note of the following:

- I. The place must be dry, clean, and well-ventilated.
- II. Check whether the floor is strong enough to bear the weight of AVR.
- III. Check whether the room is large enough for installation and maintenance.
- IV. When AVR is in operation, check whether the ambient temperature is between 0°C ~ 40°C.
- V. Relative humidity: 0% ~ 90% with no condensation
- VI. Altitude: <1000 meter
- VII. Don't place the machine directly in sunlight or near the heat source.

2.3 POSITIONING

It is important to carefully consider the place chosen to site the AVR. A position allowing access on all four sides to permit preventative maintenance would be advantageous.

As there are cooling fans mounted in the cabinets it is important that there should be adequate space around the unit. The unit should be positioned such that a free flow of air is available. It is especially important to ensure that cooling fan inlets and outlets are free from obstruction.

2.4 CABLES AND TERMINATIONS

The following cable sizes are for your reference, based on 10m of copper thermoplastic 75°C. Select the correct cable and protection, considering factors such as current rating, voltage drop, loop impedance, installation derating and short circuit.

| Cable Guide | | AVR3-50 | AVR3-80 | AVR3-100 | AVR3-120 | AVR3-150 | AVR3-200 | AVR3-250 | AVR3-300 | AVR3-400 | AVR3-500 | AVR3-600 |
|-----------------|-----------------|---------|---------|----------|----------|----------|----------|----------|----------|----------|----------|----------|
| Conductor Size | mm ² | 16 | 25 | 50 | 70 | 95 | 120 | 185 | 240 | 400 | 2x300 | 2x400 |

Table 2 - Specifications

4. WORKING PRINCIPLE

The AVR is composed of a voltage regulator circuit, a control circuitry and a servo motor. The control continually samples the input voltages, output voltage and changes in the load.

The control reacts to any changes by automatically adjusting the individual servo motors to maintain a constant output voltage.

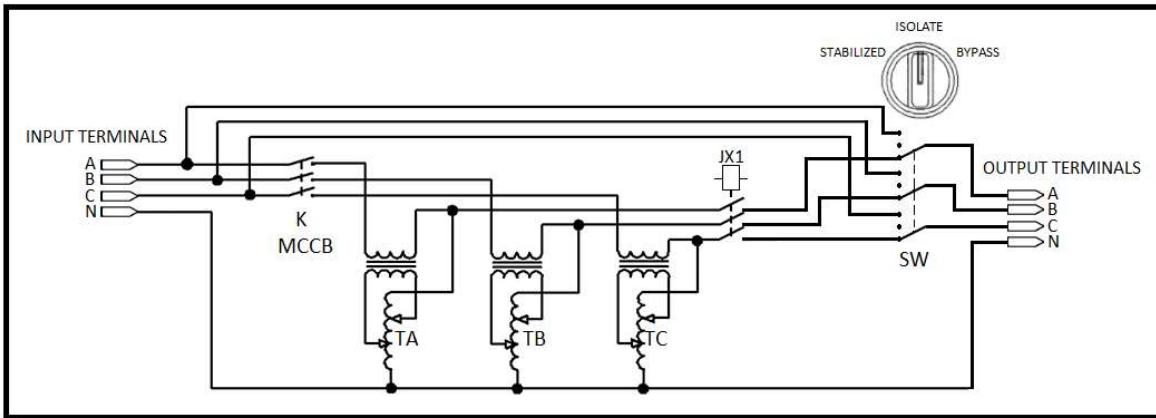

Figure 2 - AVR3

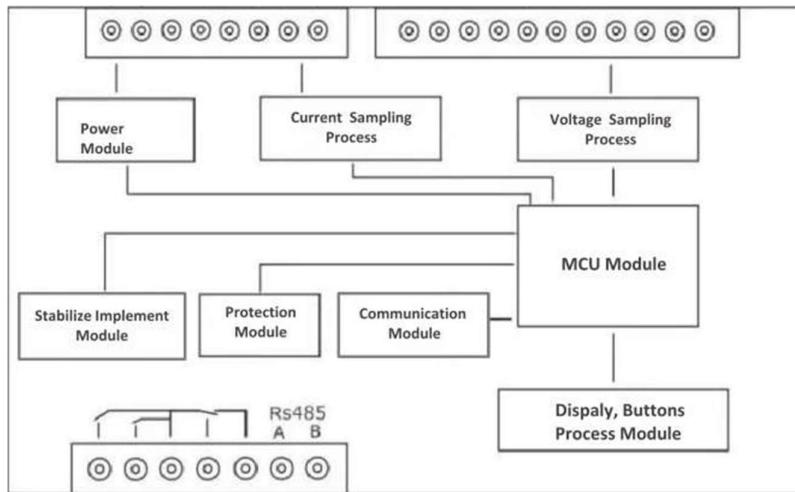

Figure 3 - AVR3 Control

5. OPERATION

5.1 START-UP

- I. Ensure the input is energized.
- II. Switch the selector switch to the 1 – “Stabilized Output” position.
- III. NOTE: The selector switches from Stabilized Output (1) / Isolate (2) / Bypass (3)
 - a. Position 1 – The load is supplied by the AVR.
 - b. Position 2 – The load is de-energized and isolated.
 - c. Position 3 – The load is supplied by unprotected power.
- IV. Switch ON the AVR – Switch K
- V. The rear door must be securely closed and locked to ensure unqualified persons do not have access to potentially lethal voltages.

5.2 ISOLATING

- I. Switch the selector switch to the 2 – “Isolate” position.
- II. Switch OFF the AVR – Switch K
- III. Ensure the rear door is securely closed and locked.

5.3 BYPASS

- I. Switch the selector switch to the 3 – “Bypass” position.
- II. Ensure the rear door is securely closed and locked.

5.4 CONTROL / LCD DISPLAY

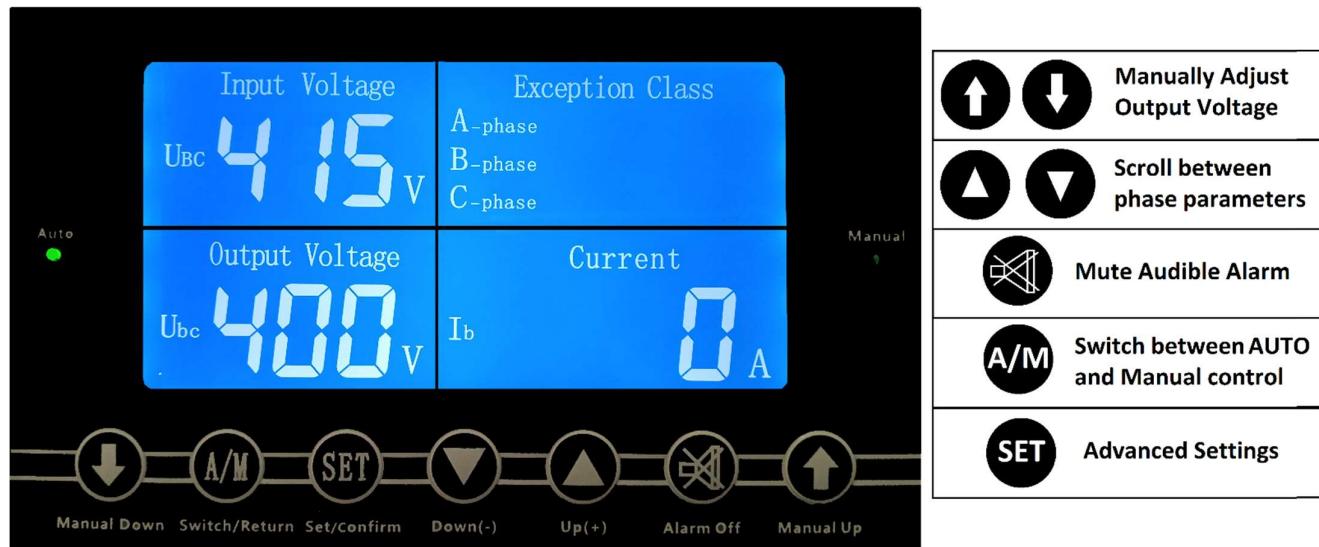

Figure 4 - AVR Display

6. MAINTENANCE

It is recommended that the AVR is maintained at least every 12 months. The duration between maintenance is depended on the operating environment.

- I. During maintenance, it the AVR's input power must be disconnected.
- II. Verify that the internal fans are operating.
- III. Check the tightness of the servo chain.
- IV. Lubricate all mechanical transmission components.
- V. Remove any contaminants.
- VI. Check that all internal components are tight.
- VII. Check the condition of the carbon brushes and replace if required.
